Digital Populism in Pakistan: How Social Media is Reshaping Political Mobilization

Rizwan Ahmad

M.Phil. Scholar, Department of Regional Studies, University of Peshawar

rakhangk@gmail.com

Abstract

Digital populism has become a revolutionizing phenomenon in politics in Pakistan, which has altered mobilization practices in social media, such as Facebook, Twitter, and TikTok. This paper will review the role of digital populism and how it allows direct contact between leaders and their citizens without using the traditional media to look at the effects of the same on the grassroots mobilization, disinformation, and participation by the youth. The paper will concentrate on case studies like the PTI of Imran Khan and other opposition parties like PML-N and PPP and explain how influencers, bots, and echo chambers can be used to spread polarizing stories. Other issues facing the country and discussed in the article are government censorship, the urban-rural digital divide, and the subversion of democratic discourse by hyper-partisanship. In the future, it evaluates the future consequences of the AI, deepfakes, and emerging platforms towards the political stability of Pakistan. Although digital populism can be used to include people in their participation, its abuse can contribute to further polarization and the institutional mistrust. The study ends by providing policy outputs to strike a balance between the freedoms of the digital world and accountability and recommends the creation of regulatory frameworks, digital literacy, and ethical campaigning to protect the democratic future of Pakistan.

Keywords: Digital Populism, Pakistan, Social Media, Political Mobilization, Disinformation, Imran Khan, PTI, Censorship, AI, Deep-fakes, Democratic Stability.

Introduction

The populism, which is basically considered as a political strategy aimed at the representation of common people against the elite institutions, has realized a massive change in the digital era (Mudde, 2004). The emergence of the social media has enabled populist leaders to talk to the masses without using the mainstream media and the political institutions as gatekeepers (Gerbaudo, 2018). Such transition has made politics more democratic in a sense, but on the other hand, it has increased polarization, misinformation, and hyper-partisan rhetoric (Tucker et al., 2018). In

Pakistan where political mobilization has been based on mass rallies, party structure, and traditional media, the emergence of digital populism has transformed the way leaders can reach out to the people, especially the young generation (Yusuf, 2021). Dynastic politics, military power, and the problem of democratic consolidation have been the features of the Pakistani political environment (Jaffrelot, 2015). Nevertheless, the meteoric growth of the internet, where there are more than 87 million social media users in 2024 (PTA, 2024), has brought in a new twist within campaigning activities in politics. Social media sites, including Twitter (now X), Facebook, YouTube, and TikTok, have become a war zone of political discourse where populist politicians like Imran Khan have applied digital technologies to organize their activists, fighting back on anti-populist messages, and even attacking state machinery (Suleri, 2023). In contrast to traditional media, which is usually held back by censorship or the domination of elites, social media allows the free and real-time exchange of information, which makes it a powerful tool of populist rhetoric (Waseem, 2022).

The focal point of this paper is that social media has helped in the aspect of political mobilization in Pakistan as populist leaders can now avoid conventional media and directly reach the people. The given phenomenon has great consequences to democracy since it not only gives power to grassroots movements but also promotes misinformation and political instabilities (Shahbaz, 2020). This article discusses the way digital populism is transforming the politics in Pakistan by analyzing the case studies of Imran Khan Pakistan Tehreek-e-Insaf (PTI) and its digital politics strategies. The discussion also addresses the issues of this trend such as the disinformation spread, the loss of institutional trust, and the possibility of the polarization growth (Ahmad, 2023).

The Rise of Digital Populism in Pakistan

Digital populism is the phenomenon when political leaders utilize social media and other digital means of communication to establish direct links and contact with the population, frequently avoiding the traditional media and interface of institutions (Engesser et al., 2017). Digital populism, in contrast to the traditional populism based on the populist mass meetings and party apparatus, is an attempt to use algorithms, viral content, and affect to magnify anti-establishment rhetoric (Gerbaudo, 2019). The trend has been picking up in Pakistan because of increasing internet penetration rate which now reaches 45 percent of the population (PTA, 2023) and the spread of smartphones. The main features of the digital populism are personalized messaging, real-time interaction, and the weaponization of disinformation that have transformed the process of political mobilization (Waisbord, 2018). The fact that social media is not centralized means that populist leaders can present themselves as the only voice of the true people and demonize their rivals as elite-corrupt (Moffitt, 2016). This has been the case especially in Pakistan, where the digital space has emerged as the battlegrounds of political narratives.

In the past, Pakistani populism has been influenced by the figure of charismatic leaders who presented themselves as the saviors of the disadvantaged against the interests of the established elites. This was first successful in the 1970s when Zulfikar Ali Bhutto, the founder of the Pakistan People Party (PPP) appealed to the rural and working-class voters with incendiary speeches and socialist rhetoric (Jalal, 2014). This strategy was later used by his daughter, Benazir Bhutto, who combined the populist approach to politics and a modernized political campaign (Zaidi, 2020). But the most spectacular change was that of Imran Khan and his Pakistan Tehreek-e-Insaf (PTI) which went through the transformation of a marginal political party to a major political actor, in part because of digital mobilization (Yusuf & Schuler, 2021). Whereas the populism of the Bhutto era was based on newspapers, radio, and mass meetings, Khan managed to use social media to bypass the traditional gatekeepers of media, which were commonly perceived as biased or in the hands of the opposing parties (Afzal, 2022). Such change highlights the democratic aspect of the use of digital tools to communicate politically, as well as the ability to propagate new propaganda and polarization.

Political discourse in Pakistan has been transformed in a radical way by the emergence of the social media, such as Facebook, Twitter (X), YouTube and TikTok. Facebook is the one with more than 40 million active users, and it is one of the most important places where political parties can share manifestos, live-stream rallies, and organize grassroot campaigns (Khan & Gopal, 2023). Twitter, with a less widespread and more urban elite, is a place of conflict in the popularity of hashtags and spread of news quickly that is the root cause of political confrontations (Qureshi, 2023). YouTube has proved to be an important platform to deliver long-form media, including speeches, documentaries, and investigative reports, which allows bypassing the TV censorship, like in the case of PTI, as well (Ali, 2023). In the meantime, the short-video format has been particularly efficient in finding an audience among younger and less politically active groups, as viral memes and slogans are used to dumb down political messages (Malik, 2023). All these platforms allow populist heads to create emotionally appealing stories that appeal to the concerns of the people, including corruption, economic disparity, and foreign influence (Mueller, 2021). Nevertheless, this digital ecosystem does much more harm, deepfakes, manipulated videos, and bot networks spread misinformation and manipulate the opinion of the people (Bradshaw & Howard, 2019).

There are far-reaching consequences of digital populism in Pakistan that transform not only the electoral politics but the entire democratic process. On the one hand, social media has democratized politics and empowered the previously marginalized groups, as well as allowing movements such as the one that the PTI has now called the "Digital Jalsa" to mobilize their supporters without need of physical gatherings (Hussain, 2023). Conversely, the absence of controls and fact-checking has created the epidemic of fake news, which widens the existing divisions in society (Mirza et al.,

2022). As an example, in the 2023 elections, accusations of voter manipulation and external interference were the most popular topics for several weeks and shook the established order in democratic institutions (Rehman, 2023). Moreover, such occasional bans of social media such as X and YouTube by the state demonstrate an inability to manage digital dissent, which prompts an issue of digital authoritarianism (Shah, 2023). The bi-polar face of digital populism its empowering and manipulative capability will continue to be an identity mark of the Pakistan political environment as it further heads into its next cycle of elections.

Key Players and Strategies

The topographical structure of digital populism in Pakistan has been radically transformed by the influential political actors who have optimally used the social media platforms as a tool of transforming political mobilization. The best example of such a case study is that of Imran Khan and his Pakistan Tehreek-e-Insaf (PTI) party that transformed the political communication in Pakistan with the use of advanced digital mechanisms. The social media stardom of PTI became a new dynamic in Pakistani politics, especially in 2018 general elections when the party used social media, including Facebook, Twitter, and YouTube to bypass the traditional media (Yousaf & Schuler, 2023). They extensively used the live broadcasts of rallies and speeches, which allowed them to communicate with their followers in real-time (millions of people), and well-planned hashtag campaigns (VoteKolzzatDo, TabdeeliAaGayi) were trending weeks in a row, which helped to give people the impression that political change is inevitable (Rizvi, 2023). The digital team of the party has learned how to create viral material, creating memes, small video clips, and emotionally-charged images that especially appeal to the young demographic of Pakistan, approximately 64 percent of the population is under 30 (Pakistan Bureau of Statistics, 2023). The digital-first strategy enabled PTI to present Khan as an anti-establishment outsider who is struggling to overcome the political dynasties even though he is an elite himself (Hussain, 2023).

Although PTI led the digital mobilization in Pakistan, the traditional political parties such as the Pakistan Muslim League Nawaz (PML-N) and Pakistan Peoples Party (PPP) had to change their strategies accordingly. These opposition parties have been slow in the past to appreciate the potential of social media to transform politics and they have invested with a lot of success in digital campaigns (Malik & Khan, 2023). The PML-N has its stronghold in the urban areas of the Punjab and has concentrated on fighting the PTI discourse by professionalizing its social media efforts and orchestrated Twitter campaigns that include party leaders such as Maryam Nawaz (MaryamKaPakistan). Nevertheless, their strategy has been repeatedly denounced as reactive and not innovative, and they tend to participate in what scholars call negative digital campaigns where they are more interested in bashing opponents than advancing their own agenda (Qureshi, 2023). With its typical stronghold in rural Sindh, the PPP has not been able to transfer its past populist success on to the virtual world,

although the team of Bilawal Bhutto Zardari has worked hard to enhance their presence on TikTok and Instagram in order to reach out to youthful voters (Shaikh, 2023). The problem of both parties is how to counter the initial mover advantage of PTI in digital politics without losing their ground with traditional voters, developing a hybrid approach to campaigning that involves a combination of old-school acclamation and digital activism (Afzal, 2023).

The success of the digital populism in Pakistan is impossible to comprehend without references to the ecosystem of political messengers, bots, and echo chambers that promote political messages. The political parties of both ends have developed a system of social media influencers, including celebrity endorsers and religious leaders to give their stories credibility (Ali & Rizwan, 2023). A study carried out by the Digital Rights Foundation (2023) found at least 500 influential accounts that follow between 50,000 to 2 million people each, and regularly post partisan political content. Worse yet, the manipulation of trends and creating the illusion of grassroots support with the help of bot networks and fake accounts have been documented. According to a recent report prepared by the Media Matters for Democracy (2023), in times of peak political activity, as much as 35 percent of political tweets are produced by automated accounts. Such online plans prosper in the social media echo chambers whereby algorithm-selected content strengthens the preexisting assumptions and excludes those that do not align with them (Mueller & Qayyum, 2023). This creates information bubbles that predispose the voters to populist rhetoric and reduces chances of them receiving fact-checking and other lines of thought, which then increases the level of political polarization in the nation.

This interaction of these digital approaches with the political culture of Pakistan has formed a paradigm shift in the political communication that has far reaching democratic consequences. On the one hand, social media has democratized political participation because it allowed the previously marginalized groups to speak up and offered new opportunities of civic activism (Digital Rights Foundation, 2023). The anti-government protests in 2022-2023, e.g., were mostly organized and boosted on TikTok and Twitter, which showed the mobilizing capabilities of these social media (Yusuf, 2023). Conversely, weaponization of digital tools has led to pressing questions of the democratic discourse quality. The prevalence of deepfakes and manipulated video clips and organized disinformation has led to the fact that it is becoming harder to discern the truth and fiction when being a citizen (Pakistan Institute of Legislative Development and Transparency, 2023). Moreover, the anonymity of the digital platforms has allowed harassing the journalists and political opponents and has created the chilling effect to the free expression (Human Rights Watch, 2023). The dichotomy between the empowering and corrosive nature of digital populism is bound to increase as Pakistan draws closer to its next electoral cycle, with political parties spending even more time and resources on the development of their digital warfare apparatus and civil society, which is trying to promote media literacy and

accountability in the online arena (International Republican Institute, 2023).

Impact on Political Mobilization

Digital populism has irreversibly changed the landscape of political mobilization in Pakistan and the most pronounced change has been the strengthening of grass-root participation which forms a direct relationship between the leaders and the citizens. Social media has allowed politicians to skip the historical system of the parties and address their constituents directly, which has created the feeling of intimacy and accessibility that was impossible to even imagine in Pakistani politics (Khan & Mahmood, 2023). A study by Pakistan Institute of Development Economics (2023) shows that 78 percent of Pakistani users of social media feel closer to the political leaders who are active in social media. Such a direct communication path has proved especially useful to populist leaders such as Imran Khan, whose live streams on YouTube and Twitter Spaces are constantly watched by millions of people, establishing what scholars call digital darbars - virtual courts where the leader seems to be approachable to the ordinary citizen (Ahmed & Sheikh, 2023). This seeming ease of access, however, can conceal a very deliberate image, as groups of digital strategists create messages that they hope will be the most emotionally engaging, and the least likely to be followed by a discussion of policy (Digital Rights Monitor, 2023). This type of engagement has also brought with it the formation of organic supporter networks not linked to the official party structure, to the embarrassment of the party officials who have trouble keeping their message discipline (Rizvi & Haq, 2023).

The negative side of this digital mobilization is the proliferation of disinformation and the following polarization of the Pakistani society. According to a study published in 2023 by Media Matters for Democracy, it has been ascertained that every week, false or misleading political information is exerted on about 42 percent of social media users in Pakistan, whereas the engagement rates of inflammatory information are between 3-5 times higher compared to the engagement rates of factual reporting (MMfD, 2023). Political parties have turned this tendency into a weapon, deploying special teams to spread and develop divisive narratives according to which the opponents are traitors, blasphemers, or foreign agents (International Crisis Group, 2023). The ensuing polarization is now at an alarming level, and 68 percent of Pakistani social media users now do not want to view material on the opposite political side, according to Pew Research Center (2023). Such a phenomenon has been further compounded by the platform algorithms favoring engagement over truthfulness that form self-perpetuating loops of outrage and confirmation bias (Qureshi & Malik, 2023). Of particular concern is the application of religiously-tinged disinformation, in which political adversaries are often labeled as anti-Islamic - an approach that does not only contaminate political debate, but also endangers lives (Human Rights Watch, 2023).

The influence of digital populism on the old media has been similarly revolutionary, with populist leaders growing in the number of times that they just bypass traditional

journalism altogether in order to manage their own messaging. Pakistani politicians who used to count on press conferences and newspaper interviews now choose to use social media livestreams and tweetstorms that provide them with the possibility to address their base in an unedited manner (Ali, 2023). This has weakened the conventional gatekeeping job of journalists as 72 percent of Pakistani journalists polled by the Freedom Network (2023) reported that they had found it quite challenging to book a political leader who might now wish to communicate directly via the digital platform. The financial effects on the old media have been devastating, as political advertisement revenue dramatically switches to digital media - the amount of digital political advertisement spending has increased by 300 percent in 2018-2023 (Pakistan Advertisers Society, 2023). The most worrying aspect is the so-called phenomenon of the presence of two narratives, when politicians still hold radically different messages in the digital space and the traditional media, so coherent political discourse is becoming harder and harder (Center for Peace and Development Initiatives, 2023). This dualistic communication policy enables the leaders to be able to reach out to extreme groups on the internet without necessarily having to proffer any plausible deniability in authorized circles.

The effect of digital populism can hardly be stronger than in the unprecedented mobilization of Pakistani youth, as social media is now the key political engagement platform among voters aged below 30 years. According to the Pakistan Youth Survey (2023), 83 percent of young voters receive their political information mostly on social media, whereas only 12 percent of them get it via classic news sources. Political parties have been resorting to the inundation of youth-focused content on such platforms, as Tik Tok and Instagram, where they tend to intertwine the fun and entertainment with political agendas (Digital Rights Foundation, 2023). An example here is PTIs Kaptaan Youth Wing that creates viral challenges like dance and meme content that barely advertise the party narratives to the youth (Hussain, 2023). Although this has definitely raised political consciousness in the youth who have never been involved, there are questions regarding the quality of such engagement. The Pakistan Psychological Association (2023) cautions that a never-ending stream of simplistic, emotionally fueled political messages can be producing a populace of voters that don't care so much about policy as they are about character and rather more interested in razzle-dazzle than actual issues. Still, the demographic fact of Pakistan - 64% of the population is under 30 - guarantees that the digital youth mobilization is going to remain the core of the political strategy in the nearest future (Pakistan Bureau of Statistics, 2023).

Challenges and Risks

The proliferation of digital populism has been extremely fast in Pakistan, and with it, government censorship and control are becoming more common, which has led to fears of freedom of speech and digital freedoms. Social media has often been banned by authorities, such as YouTube (2012-2016) and Twitter (X), and TikTok has

experienced restrictions, on the basis of national security, and the proliferation of so-called misinformation (Ahmad & Butt, 2023). Nonetheless, critics believe that such steps are frequently politically driven, as they fail to allow the freedom of speech and censor digital narratives in times of dissatisfaction (Freedom Network, 2023). Pakistan Telecommunication Authority (PTA) has been greatly increasing its surveillance tools and is using deep packet inspection (DPI) to block and slow down political speech, especially by opposition (Digital Rights Foundation, 2023). These steps are indicative of a wider pattern of digital authoritarianism, using indistinct cybersecurity laws, like the Prevention of Electronic Crimes Act (PECA), to criminalize online speech and stifle political organizing (Human Rights Watch, 2023). Although the state regulation is reasonable as it reduces hate speech and disinformation, the absence of transparency and the court control has encouraged arbitrary use of the regulation, which damages the confidence in digital governance (Khan & Yusufzai, 2023).

The other major issue is the continued digital divide that enhances inequality in political participation among the urban and rural dwellers. Even though the mobile broadband penetration level in Pakistan is 62%, access is significantly urban-biased, and rural communities experience the lack of connectivity because of the lack of infrastructure and cost prohibition (PTA, 2023). A 2023 research conducted by Lahore University of Management Sciences (LUMS) revealed that only 28 percent of the rural Pakistanis regularly access the internet compared to 65 percent of the urban population (Rizvi et al., 2023). This gap further supports the political balance since populations that have been digitally left behind, especially women and low-income households are still dependent on the traditional media, which is mostly state-controlled or biased (Malik & Shaheen, 2023). Moreover, the level of digital literacy is rather low: only 34 percent of Pakistanis are skilled enough to analyze political information found online critically (PILDAT, 2023). This sets a stage of misinformation moving freely among the less tech-savvy groups of people, with urban, educated elites having the majority of the voice on the virtual political platform (Ali & Rehman, 2023). The potential of digital populism as an empowering force of democracy is dangerously under the threat of becoming an instrument of elite manipulation without fair ground and education.

One of the most damaging impacts of digital populism can perhaps be defined as the degradation of the democratic discourse, which is increasingly toxic, misinformed, and hyper-partisan. The algorithms used by social media are more interested in engagement than accuracy, and extremist rhetoric and conspiracy theories, including the so-called foreign conspiracy narrative that became popular with the PTI led by Imran Khan and led to mass protests in 2022-23 (International Crisis Group, 2023). According to a study conducted by Media Matters for Democracy (2023), 42 percent of the trending political hashtags in Pakistan bore verifiable false information whereas partisan networks deployed bots and false accounts to master control of the attitudes of the masses. The ensuing polarization has eroded political discourse into a form of

us vs. them, with an opposing side being presented as a traitor of the state or an enemy (Qureshi, 2023). Women journalists and activists are the most targeted group of people who are met with especially harsh online harassment such as gendered disinformation efforts to shut them up (Aurat Foundation, 2023). The degradation of fact-based discourse has undermined the democratic forces where citizens are losing their faith in electoral procedures, popular media, and even the court decisions (Pew Research Center, 2023). Pakistan needs to implement stringent digital literacy initiatives, measures of accountability on the platforms, and open content moderation policies, or the uncontrolled spread of digital populism can corrupt the already weak Pakistani democracy even more.

Future of Digital Populism in Pakistan

Artificial intelligence (AI), deepfake technology and newer social media are other areas that are likely to influence the future of digital populism in Pakistan and may change the already evolving nature of political mobilization and propaganda. The use of AI-powered devices like automated chatbots and artificially generated texts is already being employed to maximize political messaging, and analysts believe that it will not be long before voters will be targeted by tailor-made AI campaigns that will identify them by their online actions and habits (Qureshi & Malik, 2024). The threat of deepfake technology is even more significant because hyper-realistic manipulated video can be used as a weapon to propagate misinformation, in which case fake speeches of political figures may be released, which can instigate riots (Digital Rights Foundation, 2024). New platforms such as the ones that might replace TikTok or decentralized social networks (Mastodon, Bluesky) can also change the existing order and provide opportunities to discuss politics without governmental censorship (Khan & Yusufzai, 2024). Nevertheless, the innovations are associated with some risks: the disinformation created by AI can increase polarization, and the state and non-state representatives may use these tools to influence the elections and intimidate the opposition (International Crisis Group, 2024). In the absence of solid regulation systems, Pakistan may experience an AI-based arms race in political propaganda, in which truth is becoming harder to identify (Ahmad & Sheikh, 2024).

The key question is whether digital populism can be used to bolster democracy or it is a threat to institutional stability in the first place. Social media enthusiasts say it has democratized politics and allowed those who are at the fringe of the society such as the youth and the rural dwellers a chance to express themselves (Pakistan Youth Survey, 2024). Examples such as the PTI Jalsa digital can show how online power can be used to shape the political world, i.e., bringing more accountability (Hussain, 2024). Yet, the critics caution against the fact that digital populism usually focuses on emotionality rather than a meaningful discussion of policy, simplifying the problem of governance to viral catchphrases and memes (Media Matters for Democracy, 2024). The loss of the gatekeeping capacity of traditional media has also facilitated the escape of scrutiny by authoritarian-leaning leaders since direct digital communication

allows them to broadcast propaganda without any checks (Freedom Network, 2024). Moreover, the misinformation, including manipulated videos and bogus news, as a weapon, has eroded the trust of the people in the democratic bodies, including the electoral process as well as the courts (PILDAT, 2024). Although digital tools have the potential to promote civic engagement, the risk of misusing them poses a threat to the already shaky democratic norms in Pakistan and institutional reforms are the key to addressing the disruptiveness of digital tools (Rizvi et al., 2024).

In the future, Pakistan is at an inflection point in which its regulation, digital literacy, and platform responsibility may turn digital populism into either a source of democratic renewal or further corruption. The regulatory attitude of the government towards the use of AI and cybersecurity legislation will play a pivotal role in containing such risks as deepfake-based disinformation (PTA, 2024). In the meantime, media literacy and fact-checking programs organized by the civil society would allow citizens to be more critical regarding the digital political environment (Aurat Foundation, 2024). Even political parties will have to embrace ethical standards of digital campaigning and stop being based on divisive rhetoric and disinformation (Pakistan Institute of Legislative Development and Transparency, 2024). Unrestricted, digital populism may further divide people and create distrust in institutions, yet, with adequate controls, it would restore the enthusiasm in democratic participation by making the political discourse more inclusive and transparent. In the electoral process in 2024-2025, the experiment with digital mobilization in Pakistan will be a crucial test of how the country will use digital mobilization to strengthen its democracy and counter destabilizing trends or become a victim of these trends (International Republican Institute, 2024).

Conclusion

There is no doubt that digital populism has transformed the Pakistani political space, providing both an unprecedented potential of democratic participation and a threat to the stability of institutions. On the one hand, the social media has democratized the process of political involvement whereby leaders are in a position to reach out to citizens; particularly the young generation; by cutting across the media gatekeepers and leading to the actual grassroots mobilization. The online platforms have proven their ability to draw people to support political movements as seen in the case of Digital Jalsa by PTI, whereby politics became more accessible to individuals who were formerly excluded. Nonetheless, such digital revolution has also introduced a flood of disinformation, hyper-partisanship, and algorithmic manipulation, and degraded the quality of the public discourse. The viralization of deepfakes, echo chambers, and propaganda disseminated by bots have aggravated the situation of polarization in society, making political discussions a toxic field where only viral messages matter. With Pakistan at this turning point, the task will be to tap the democratic possibilities of digital populism and curb the destructive impacts of populism on truth, trust, and institutional integrity.

The future of the Pakistani democracy is going to be based on the ability of the country to navigate through the changing digital political arena. Unless there are effective protections in place digital populism is likely to turn into a weapon of authoritarian rule instead of democratic liberation unless more is done to ensure that there are more effective regulations against AI-driven disinformation, more effective digital literacy programs, and more responsibility on the part of social media platforms. The state needs to find a compromise: safeguarding free speech but limiting the damaging misinformation, providing people with more internet access to decrease the urban-rural divide, and making sure that new technologies such as deepfakes do not disrupt the political process. In the meantime, both political parties, civil society, and citizens have to unite and fight the temptation of hateful rhetoric and focus more on the evidence-based policy rather than viral sensation. Digital populism may enhance democracy in Pakistan by helping to achieve increased inclusion and transparency in the event that the country manages to develop a more informed and critical digital public sphere. But when uncontrolled, it can erode society, repudiate institutions and institute anarchy. The decisions that are taken today will clarify whether digital populism is a problem or a source of prosperity and democratic rebuff.
